LEC23 - Abstract Syntax Trees Continued

Modules

- A module is a class that represents an entire Python program
- Its body is a list of statements
- Ex. `[gpa = 4, student_name = 'Sue Flay', print(student_name), print(gpa)]`
 - Contains 4 statements

Implementing Control Flow Structures

```
if <condition>:  
    <body> # List[Statement]  
else:  
    <body> # List[Statement]  
  
for <target> in range(<start>, <stop>):  
    <body> # List[Statement]
```
